Polyurethane foam
sealing tape for
inset stainless steel sinks

In order to secure weatherproofness during the installation of an inset sink, and to prevent any possible water damage to the work top, it is essential to create a watertight seal between the sink and the work surface by applying a sealant

around the underneath of the sink's rim.

This sealant could be provided separately, in the form of a tape or it could be preinstalled on the underside of the rim's edge.

Pyramis recently invested in a new Polyurethane injection system. The new equipment automatically applies a sealant of polyurethane underneath the sink, thus, the installation of an inset sink becomes much easier and friendlier since, the sealant is preinstalled and provides time-saving compared to other sealing methods.

What is Polyurethane?

Polyurethane is a polymerizable liquid which when properly mixed with a special activator becomes a thick, semigel which covers the rim of the sink underside and works as an impermeable barrier to water after the installation of the sink.
